

Meilisearch for Olam Agri (Simple Answer Sheet)

Date: 30 March 2026

1) Will Meilisearch reduce performance?

Short answer: it can, if we run indexing without limits. Search can stay fast if we control indexing jobs.

- Keep indexing and user search on separate resource limits.
- Run indexing in smaller batches (for example every 5 to 15 minutes).
- Track 3 numbers daily: search response time, indexing queue size, CPU usage.

2) How to integrate with Olam Agri?

Use a simple 4-step data flow. Keep SAP and other core systems as the source of truth.

Step	Simple explanation
Step 1	Read approved data from source systems (SAP, internal apps).
Step 2	Use middleware to clean and map data.
Step 3	Push mapped documents to Meilisearch indexes.
Step 4	Frontend calls search API and shows results.

3) What are the requirements?

- Data owner for each search index (business owner).
- One middleware service to map source data to search documents.
- Access control: API keys on backend only, never hardcoded in frontend.
- Monitoring: CPU, memory, disk, and search latency dashboards.
- Backup and restore process tested before production.

4) Self-host options

Option	When to choose
Single VM / container	Best for pilot and small rollout.
HA self-host cluster	Use when uptime target needs failover.
Managed cloud	Use when team wants less infrastructure work.

5) How to integrate (implementation steps)

- Week 1-2: choose one use case and define index fields.
- Week 3-4: build middleware mapping and first index sync.
- Week 5-6: connect frontend search and apply access control.
- Week 7-8: load test, fix relevance, run backup/restore drill.
- Week 9-12: controlled production rollout.

6) What are the blockers?

- Unclear data ownership between teams.
- Complex field mapping from SAP to search format.
- No agreed SLA for response time and uptime.
- Missing monitoring and no restore test.
- Security risk if keys are exposed in client apps.

Final recommendation

Start with one business domain. Keep the architecture simple. Put performance limits and security controls from day one. Scale only after pilot metrics are stable.
